

Pre-Planning Site Of Build

When you have made the decision to purchase a walk-in cooler or freezer you need to take the proper steps to ensure your site is prepped and ready to be built on. You will want to ensure your floors are level to be sure there will be no gaps at the base of your cooler (if gaps are present, it can cause issues with your refrigeration equipment).

When you have made the decision to purchase a walk-in cooler or freezer you need to ensure you select a reliable HVAC technician to not only install your refrigeration equipment, but also do the recommended bi-yearly maintenance to your units. You also want to be sure that you have someone on standby to come and fix any issues that may arise in the meantime.

When you purchase your walk-in cooler or any other building structure altering improvement, you will always want to check with your county to see if there are any restrictions. Some counties have requirements that have to be met before the building process can commence. These requirements include but are not limited to permitting, architects, DHEC regulations, ECT.

When you have decided to purchase your walk-in cooler, you will want to ensure that you have an electrician selected to install the electrical hook ups for your refrigeration equipment. An electrician will also be needed to wire in the lights for your cooler, and if you receive a walk-in freezer, you will need to have the heater wire in the door installed by an electrician.
